

P-17 Review Package: Central District

Application

- Source system: simulated intake review
- Document ID: SCE-INBOX-001
- Version: 1.0
- Applicant: TechBond Service, Central District
- Status: submitted for completeness review

This dossier combines the application, attached performance data, and status of organizational evidence. Information is deliberately distributed across several sections. A decision must not rely only on the summary or one performance figure.

Purpose and requested scope

Central District used P-17 for six weeks in two service teams. The teams handle questions about delivery status, product use, and safety documents. The site requests local approval for all 46 customer-service employees.

The application emphasizes fewer transfers and frequent use of the suggested knowledge articles. Site Management expects shorter handling times. Broader use would include additional product groups and shift times that were not fully represented in the test.

The requested decision is not a performance review alone. The reviewer must also check the independent repeat, Information Security, Privacy, retention, and traceability.

Local test design

The site recorded new customer requests during normal service hours. Automated system messages and internal training cases were supposed to be excluded. For every completed request, employees confirmed professional correctness and whether a transfer was required.

A local Quality reviewer checked duplicate records and a sample of correctness ratings. The document names analysis ID ANA-P17-CENTRAL-DISTRICT-150-FINAL. The application mentions a separate independent repeat, but the corresponding report is not attached.

The application contains several attachment references. Not every announced attachment was uploaded. Naming an attachment is not evidence that the document is present.

Final verified performance

The final verified dataset contains 150 valid customer requests. Of those, 134 were resolved correctly within 24 hours. The site reports a final verified result of 89%. The case list and review record are identified as QA-P17-CENTRAL-DISTRICT-150 and ANA-P17-CENTRAL-DISTRICT-150-FINAL.

The local performance metric is above the target in the Project Brief. The application also includes a topic summary: delivery status had the strongest result, while safety-document questions more often required specialist transfer.

The performance evidence appears complete and contains no second conflicting final analysis. This is still insufficient for approval review because the project rule requires several independent conditions.

Security and privacy documents

The attachment list names SEC-P17-CENTRAL-DISTRICT-07 as the security report. The file itself is missing, so the reviewer cannot establish whether critical findings remain open. An email in the package claims that there are no major issues, but it does not replace the formal report.

Privacy assessment DPA-P17-CENTRAL-DISTRICT is marked draft and not approved. The production-retention section is blank. No approved deletion plan is attached.

The independent-repeat report is announced as REP-P17-CENTRAL-DISTRICT but is also missing. There is therefore no evidence that a second test reached at least 85%.

Completeness review

The package includes a final verified local performance result, a traceable analysis ID, and a case-list ID. It does not include the announced security report, approved privacy documentation, production retention rule, or independent-repeat report.

The high performance figure cannot override missing mandatory evidence. The workflow must extract the facts that are present, name each missing item separately, and route the package to human clarification.

An automatic READY FOR APPROVAL REVIEW outcome would be wrong. NOT READY based on performance alone would also be wrong because the submitted performance metric meets the target. The problem is unverified completeness.

Applicant follow-up information

Central District has named Quality, Information Security, and Privacy as the owners of the outstanding attachments. The site contact can provide a revised package after those functions have completed their work.

No date has been promised for the missing independent repeat. The application remains unchanged until the referenced files are actually included. A filename in an attachment list is not proof that the underlying file exists.

The intake system records the package as awaiting clarification. It does not contain a committee decision, an approval statement, or permission to infer missing values.
