

P-17 Review Package: Complete Central Site Application

- Source system: simulated intake review
- Document ID: SCE-INBOX-002
- Version: 1.0
- Applicant: TechBond Service, Central Site
- Status: submitted for completeness and rule review

This dossier contains performance data, independent confirmation, and organizational evidence.

Attachments are described in several sections. The workflow must check the conditions traceably, not automatically approve rollout.

Application and planned use

Central Site requests permission to use P-17 as a support tool in four service teams. Employees remain accountable for every response. Planned use includes questions about delivery status, product applications, and technical data sheets.

Site Management reports better initial routing and fewer follow-up questions. It requests consideration by the Steering Committee, not automatic production launch. A committee date is assigned only after document review is complete.

The package refers to a local final analysis, independent repeat, security report, privacy approval, and retention plan. Every named file is included in the dossier and has a unique ID.

Test plan and traceability

The local test followed the P-17 test plan. Valid customer requests had to be resolved professionally correctly within 24 hours. Duplicate imports, training cases, and system tickets were excluded under predefined rules.

The final case list has ID QA-P17-CENTRAL-300. The final analysis is registered as ANA-P17-CENTRAL-300-FINAL. Two Quality reviewers confirmed the exclusion list. No second file also claims final status.

A different team performed the independent repeat. Its case list and analysis are documented separately, making it possible to distinguish local test evidence from independent confirmation.

Local final result

The final verified dataset contains 300 valid customer requests. Of those, 264 were resolved correctly within 24 hours. The final verified result is 88%. The report is marked final and references the complete case list.

The analysis contains no open data-quality warning. Twelve duplicate imports and six training cases were already removed under the predefined rules. Those excluded records are not part of the 300 valid requests.

The local value exceeds the mandatory target. This fact alone does not determine the overall outcome; the independent repeat and organizational evidence must also pass.

Independent repeat

The independent team reviewed 180 valid customer requests using the same evaluation method. Of those, 158 were resolved correctly and on time. The final verified repeat result is 88%. Its analysis ID is ANA-P17-CENTRAL-REPEAT-180-FINAL.

The report includes case list QA-P17-CENTRAL-REPEAT-180 and is approved by Central Quality Assurance. No conflicting final value exists. Both the local test and the independent repeat meet the performance rule.

The repeat is separate evidence. It must not be added to the local result to claim a larger sample. For the decision, it is sufficient that both tests are independently traceable and each meets the target.

Security, privacy, and retention

Security report SEC-P17-CENTRAL-12 contains no open critical finding. Two medium findings were closed before submission, and closure evidence appears in the report.

Privacy approval DPA-P17-CENTRAL-APPROVED is approved by the responsible function. Retention plan RET-P17-CENTRAL-180D defines a production retention period of 180 days followed by automated deletion. This period applies only to Central Site and must not be presented as a general P-17 rule.

Access and approval roles are documented. Employees see only the content required for their service case. The final customer response remains a human action.

Submission and committee boundary

Central Site submitted the local analysis, independent-repeat report, security report, privacy approval, and retention plan as one package. The intake record lists every referenced ID and reports no missing attachment.

The Steering Committee remains accountable for the final business decision. Neither the site application nor an automated review can grant rollout approval or start production use.

The committee requests a concise evidence summary that keeps local and independent results separate, identifies the organizational evidence, and links each decision-relevant statement to its document ID.
